Guide to Infection Control

Protect Your Life from the New Coronavirus!

Gifu Prefecture

1 This is how the new coronavirus spreads.

- The virus can be transmitted by coughing, sneezing, or talking.
Droplets containing the virus within 2 meters directly stick to the eyes, nose, or mouth.
(**Droplet Infection**)
- Inhaling airborne particles floating in the air for a long time in an enclosed space, whether indoors or outdoors, where people gather, exercise, shout, sing, etc.
(**Airborne Infection**)
- Touching the eyes, nose, or mouth with your fingers that have been exposed to the virus through direct contact with others or by touching infected objects
(**Contact Infection**)

2 Watch out for these activities and situations.

- Without wearing a mask, approaching or talking within 2 meters of people
- Talking over a meal with people who do not live together
- One or more of the following can be dangerous (both indoor and outdoor):

Closed Spaces with poor ventilation,
Crowded Places where people gather,
or **Close-Contact** with others.

3 New coronavirus infection can be prevented if basic measures are taken.

- The mouth and nose are main entry points for viruses.
Protect yourself from infection with a mask.
(**Use a mask** to block the virus entry from the nose and mouth.)
- **Hand hygiene** can save lives. (Washing with soap and water and/or disinfecting with alcohol are both effective.)
- Eat quietly (**silently eat**).
Wear a mask whenever you talk, even during meals.

4 Let's work together to block the virus!

- Regularly ventilate the room to replace the air (at least twice an hour, for at least 5 minutes each time).
- If infection control is not being followed around you by others, inform them what to do (masks, hand hygiene, etc.).
- If you feel unwell, be sure to rest, stay at home, and see a doctor as soon as possible.
